

How can I use the Call/Cancel custom HOOK program to get the start and end time of every CALLED program?

The `iscobol.call_cancel.hook` runtime property can be used to provide the name of a custom class that will intercept the before and after moments of every CALL and CANCEL statement during a runtime session. That class would be written as an implementation of the `isCOBOL jCallHandler` runtime class.

In this KB article we show how to write a class with `isCOBOL OOP` in order to get the start time and end time of every call, along with a couple of other pieces of information about the execution: the calling program and the called program.

The `MYCALLHANDLER` class provided with this article is based on the `MYCALLHANDLER.cbl` provided with the `isCOBOL JDK` samples and adapted to our goals.
