How do I connect to a MS SQL 2005 Named Instance?

Question:

What should I do if I have more than one MS SQL Server instance in the same computer/server, and I want to connect to any of its named instances and not to the default one?

Answer:

Make sure you have followed the general instructions on the article called <u>"How do I set up isCOBOL ESQL Generator for use with Microsoft SQL Server?"</u> before applying the specifics described below.

Use the "SQL Server Configuration Manager" software that comes with your MS SQL product and follow these steps:

- 1. Click SQL Server Network Configuration
- 2. Double-click "Protocols for myNamedInstance"
- 3. Enable TCP/IP protocol (right-click TCP/IP, enable)
- 4. Double-click TCP/IP (to view its properties)
- 5. Click IP Addresses tab
- 6. Go to IPAll section, change the TCP Port to 1435 (or any other available TCP/IP port)
- 7. Click OK to save configuration

Change the jdbc.url setting in the iscobol.properties as follows:

is cobol.jdbc.url=jdbc:sqlserver://computername:1435; user=sa; password=mysapassword; DatabaseName=mydbname
