

How would I create my own CBL_ALLOC_MEM and CBL_FREE_MEM routines?

Here are some examples:

```
IDENTIFICATION DIVISION.      PROGRAM-ID. CBL_ALLOC_MEM.      ENVIRONMENT DIVI
SION.      DATA DIVISION.      LINKAGE SECTION.      01 LNK-MEM-POINTER      POINTER
.      01 LNK-MEM-SIZE      UNSIGNED-INT.      01 LNK-FLAGS      UNSIGNED-IN
T.      PROCEDURE DIVISION USING LNK-MEM-POINTER
      LNK-FLAGS.      MAIN.      IF LNK-MEM-SI
      LNK-ME
      M-SIZE      CALL "calloc" USING BY VALUE 1
      ZE GREATER THAN ZERO      RETURNING LNK-MEM-
      BY VALUE LNK-MEM-SIZE
      POINTER      END-IF.      GOBACK.
```

```
IDENTIFICATION DIVISION.      PROGRAM-ID. CBL_FREE_MEM.      ENVIRONMENT DIVIS
ION.      DATA DIVISION.      LINKAGE SECTION.      01 LNK-MEM-POINTER      POINTER.
      PROCEDURE DIVISION USING LNK-MEM-POINTER.      MAIN.      IF LNK-MEM-POIN
TER NOT EQUAL TO ZERO      CALL "free" USING BY VALUE LNK-MEM-
      POINTER      END-IF.      GOBACK.
```

Note that both of the above programs must be compiled with the -cp POINTER compatibility option.

On Windows the `calloc()` and `free()` functions are in `MSVCRT.DLL` which must be preloaded by specifying `iscobol.shared_library_list=msvcrt.dll`.

For example, the following test program allocates and frees 100 bytes:

```
id division.program-id. test.data division.working-storage section.77 mem-ptr usage poi
nter.procedure division.main-logic.  call "CBL_ALLOC_MEM" using mem-
ptr, by value 100, by value 0.  call "CBL_FREE_MEM" using by value mem-ptr.
```

To compile and run:

```
iscc -cp CBL_ALLOC_MEM.cbliscc -cp CBL_FREE_MEM.cbliscc -cp test.cbljava -Discobol.shared_library_list=msvcrt.dll TEST
```
