How do I center a window on the desktop?

To center a window use W$CENTER_WINDOW. Pass the window handle to this library to center the window on the current screen:

```
    call "W$CENTER-WINDOW"  using windowHandle
```

You can also pass the screen index to center your screen on a different monitor.
Use C$MONITOR's opcode GET-NO-MONITOR to get the number of monitors available and pass the number of the monitor you want to center your application in:

```
    call "C$MONITOR" using cmonitor-get-no-monitor                monitor-
count,                    main-index.   if monitor-count >= 2      call
 "W$CENTER-WINDOW" using windowHandle,                            2   end-if.
```

Use the inquire verb to get the current screen index

```
    inquire windowHandle, screen-index in scr-num.
```
