Does isCOBOL support C$REDIRECT?

C$REDIRECT is used to assign a different file I/O handler to a file.
There are several options to do the same in isCOBOL.

In version 2022R2 and later, you can write a hook program using this configuration to change the file handler class in the hook program.:

```
iscobol.file.index.open_hook=Program Name
```

If you are using a version before 2022R2, another option is to write an intermediary class, and assign that class as the file handler using "iscobol.file.index.".
There is an example of this in isCOBOL's Sample folder, %ISCOBOL%sampleextend-and-customizecustom-file-handlerlogging.
This program can be modified to handle your file operations at the interface level.
For example, if you want to call subprograms named BEFOREWRITE and AFTERWRITE before and after ever WRITE operation, you could edit the sample file CobLogging.cbl and change the "write" method to the following:

```
       IDENTIFICATION DIVISION.      METHOD-ID. MY-WRITE AS "write".     WORKING-
STORAGE SECTION.      77  RETURN-
VALUE OBJECT REFERENCE
 JLONG.      LINKAGE SECTION.      77
 THERECORD  OBJECT REFERENCE JBYTEARRAY.      77
 OFFS      OBJECT REFERENCE JINT.        77
 RECSIZE   OBJECT REFERENCE JINT.           77
 FLAGLOCK   OBJECT REFERENCE
JBOOL.      PROCEDURE DIVISION USING
 THERECORD,              OFFS,              RECSIZE,              FL
AGLOCK           RETURNING RETURN-
VALUE.     MAIN.          *Trigger action - s
tart        CALL "BEFOREWRITE" USING
 THERECOR
D, OFFS,          RECSI
ZE, FLAGLOCK.    *Trigger action - end        SET
 RETURN-VALUE TO MY-ISAM:>
write (THERECORD,                  OFFS,                  RECSIZE,
              FLAGLOCK).
   *Trigger action - start        CALL "AFTERWRITE" USING
 THERECOR
D, OFFS,          RECSIZE, FLAGLOCK.    *Trigger action - end        GOBACK.
```
