

How can I get the system-information data from the client computer?

The best way to do this is to use CALL CLIENT using the C\$SYSINFO library routine. It returns information about the current operating system.

This library routine produces the same result as the ACCEPT SYSTEM-INFO FROM SYSTEM-INFO statement.

However, in a Thin Client environment, the ACCEPT approach would return the system-information data from the server, while the CALL CLIENT "C\$SYSINFO" would return the specific client information.
