

How can I get the system-information data from the client computer?

The best way to do this is to use **CALL CLIENT** using the **C\$SYSINFO** library routine. It returns information about the current operating system.

This library routine produces the same result as the **ACCEPT SYSTEM- INFORMATION FROM SYSTEM-INFO** statement.

However, in a Thin Client environment, the **ACCEPT** approach would return the system-information data from the server, while the **CALL CLIENT "C\$SYSINFO"** would return the specific client information.
