

How can I get the system-information data from the client computer?

The best way to do this is to use `CALL CLIENT` using the `C$SYSINFO` library routine. It returns information about the current operating system.

This library routine produces the same result as the `ACCEPT SYSTEM-INFORMATION FROM SYSTEM-INFO` statement.

However, in a Thin Client environment, the `ACCEPT` approach would return the system-information data from the server, while the `CALL CLIENT "C$SYSINFO"` would return the specific client information.
