

How can I read a data written with a different encoding?

Having the need to read a data, for example from a sequential file, written in UTF-8 on a machine where the default encoding is the Cp1252 you can use a java function that allow to 'translate' the data from the source encoding to the destination encoding

In attachment a cobol program that reads a sequential file written in UTF-8 and thru the paragraph RECORD-CONVERSION is able to translate in the Cp1252
