Running isCOBOL Tools in Dark Mode

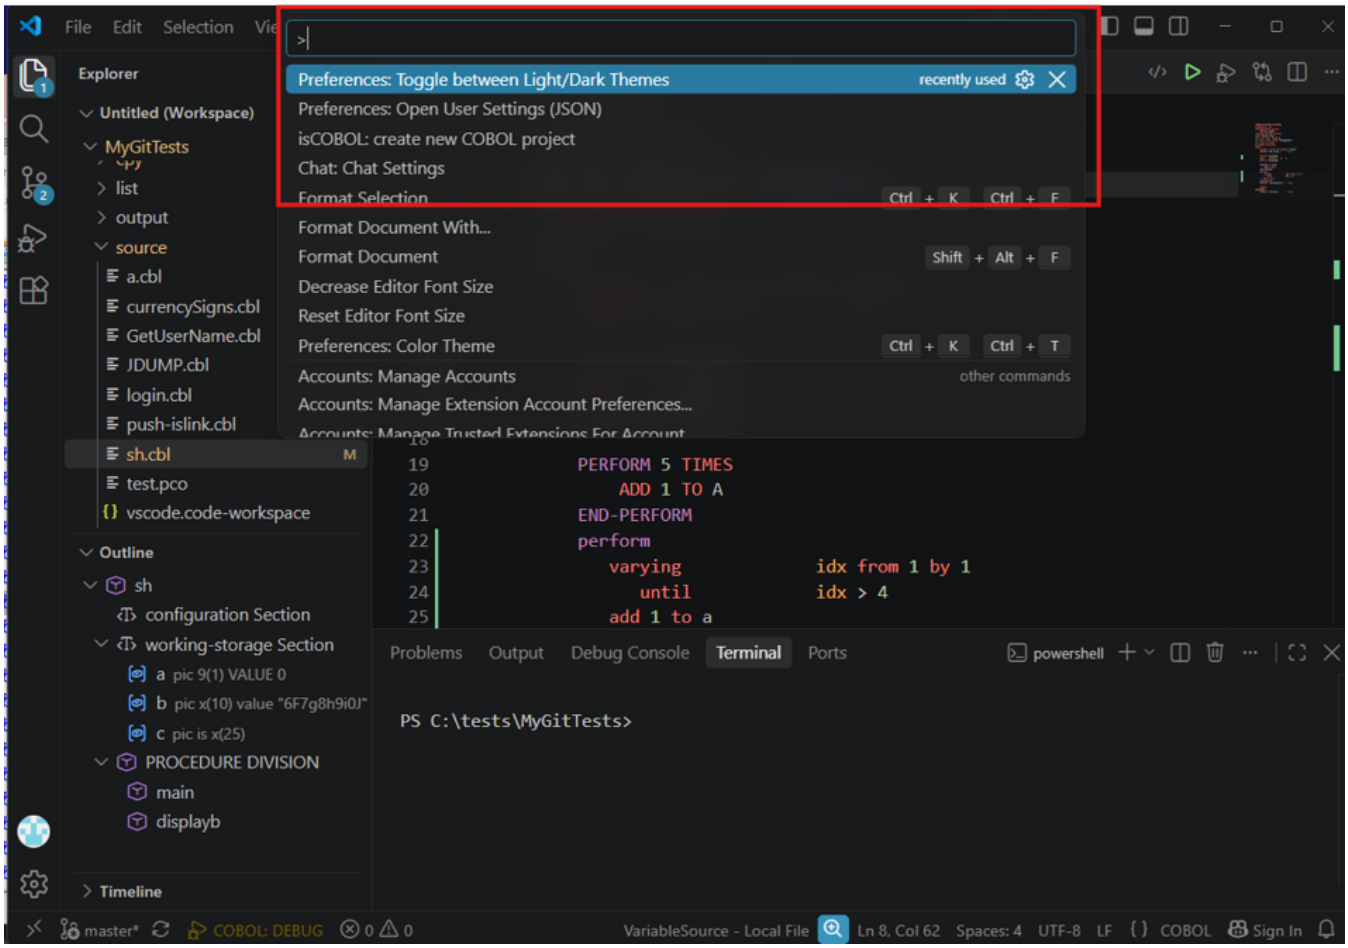

Starting with 2026R1, Veryant added dark mode support for VS Code and the Graphical Debugger. In 2026R2, dark mode support was added to the Application Server Administration Panel and Gife.

VS Code

Open the Command Palette and run:

> Preferences: Toggle between Light/Dark Themes

Select the theme you want to use.

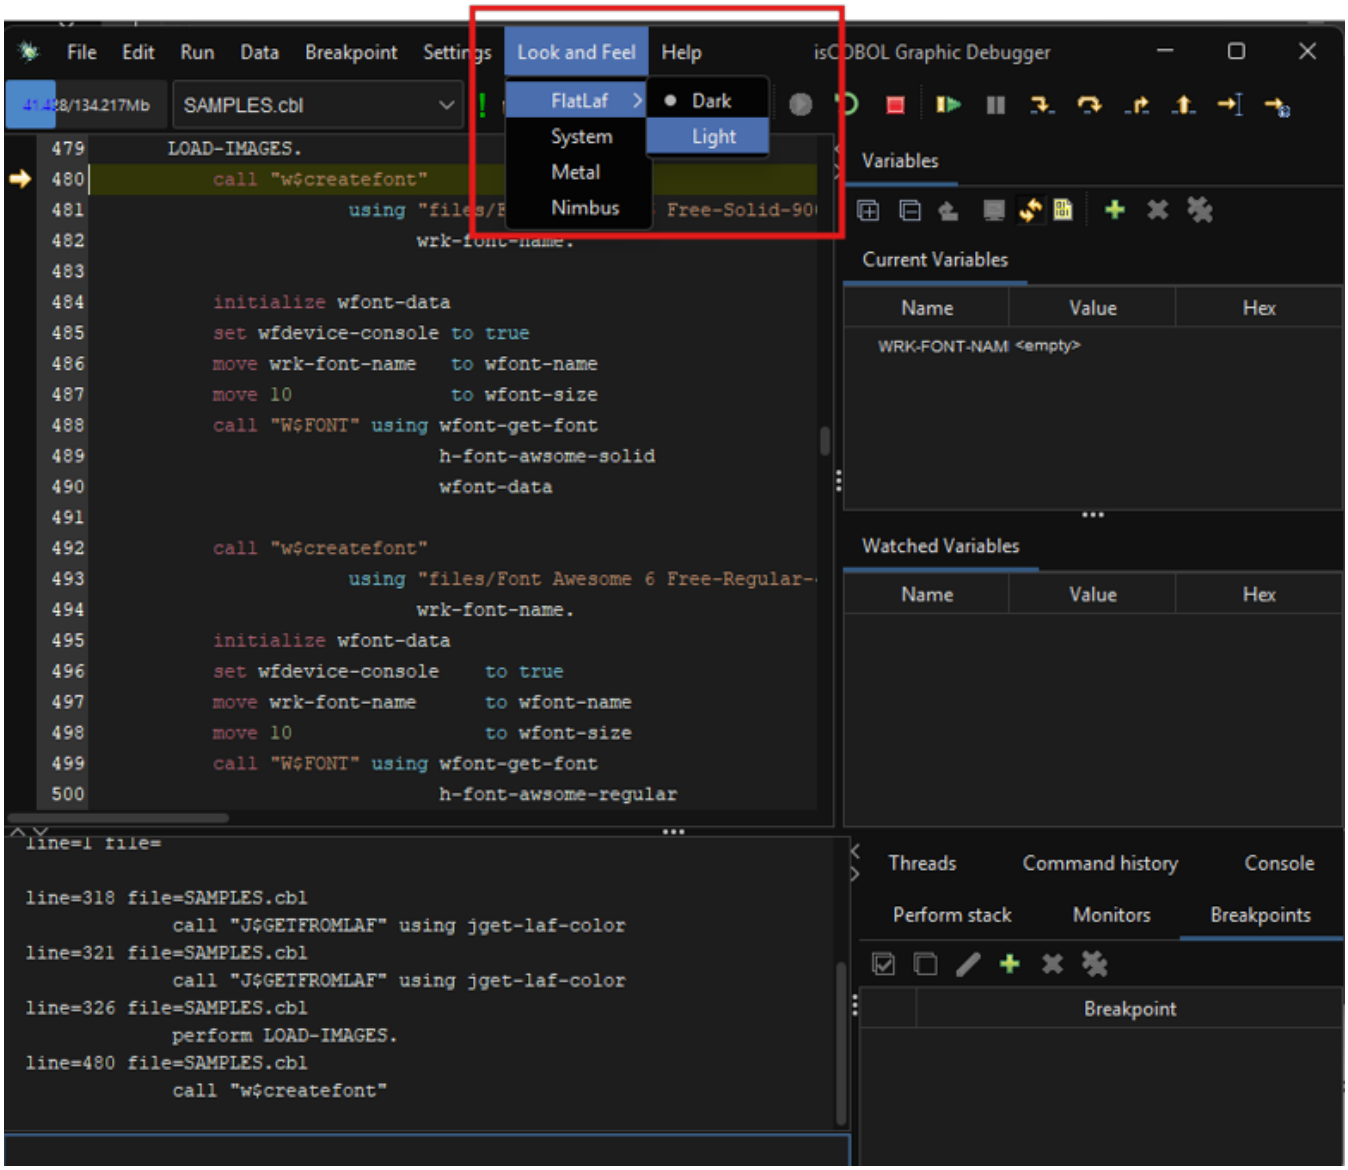

Graphical Debugger

To switch between light and dark mode, use the Look and Feel menu.

The selected theme is saved automatically and will be used for future debugging

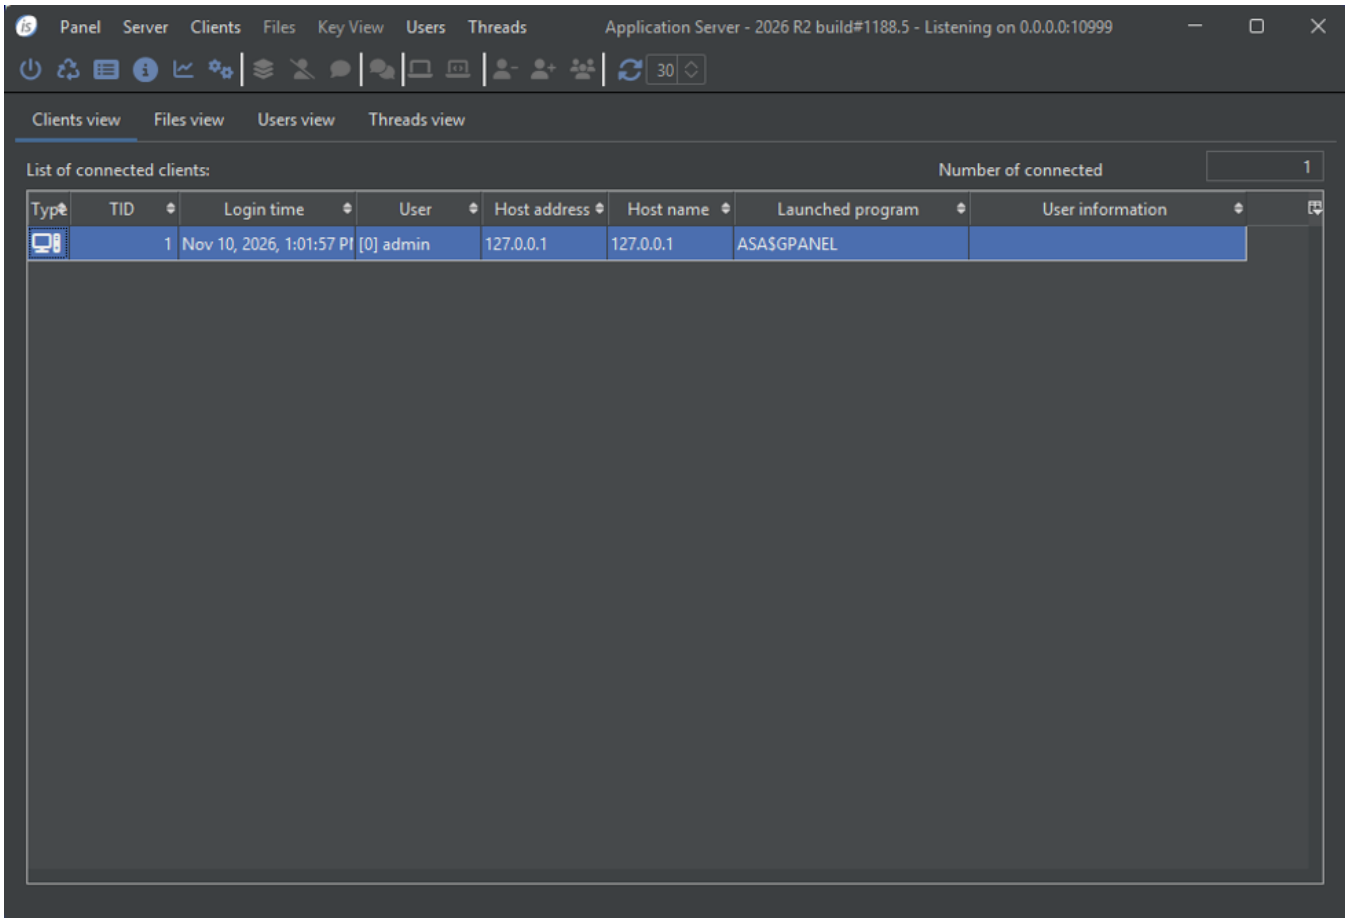

sessions.

Application Server Administration Panel

To run the Application Server Administration Panel in dark mode, add the --flatlaf FlatDarkLaf option to the command line:

iscclient --flatlaf FlatDarkLaf -user admin -password admin -panel

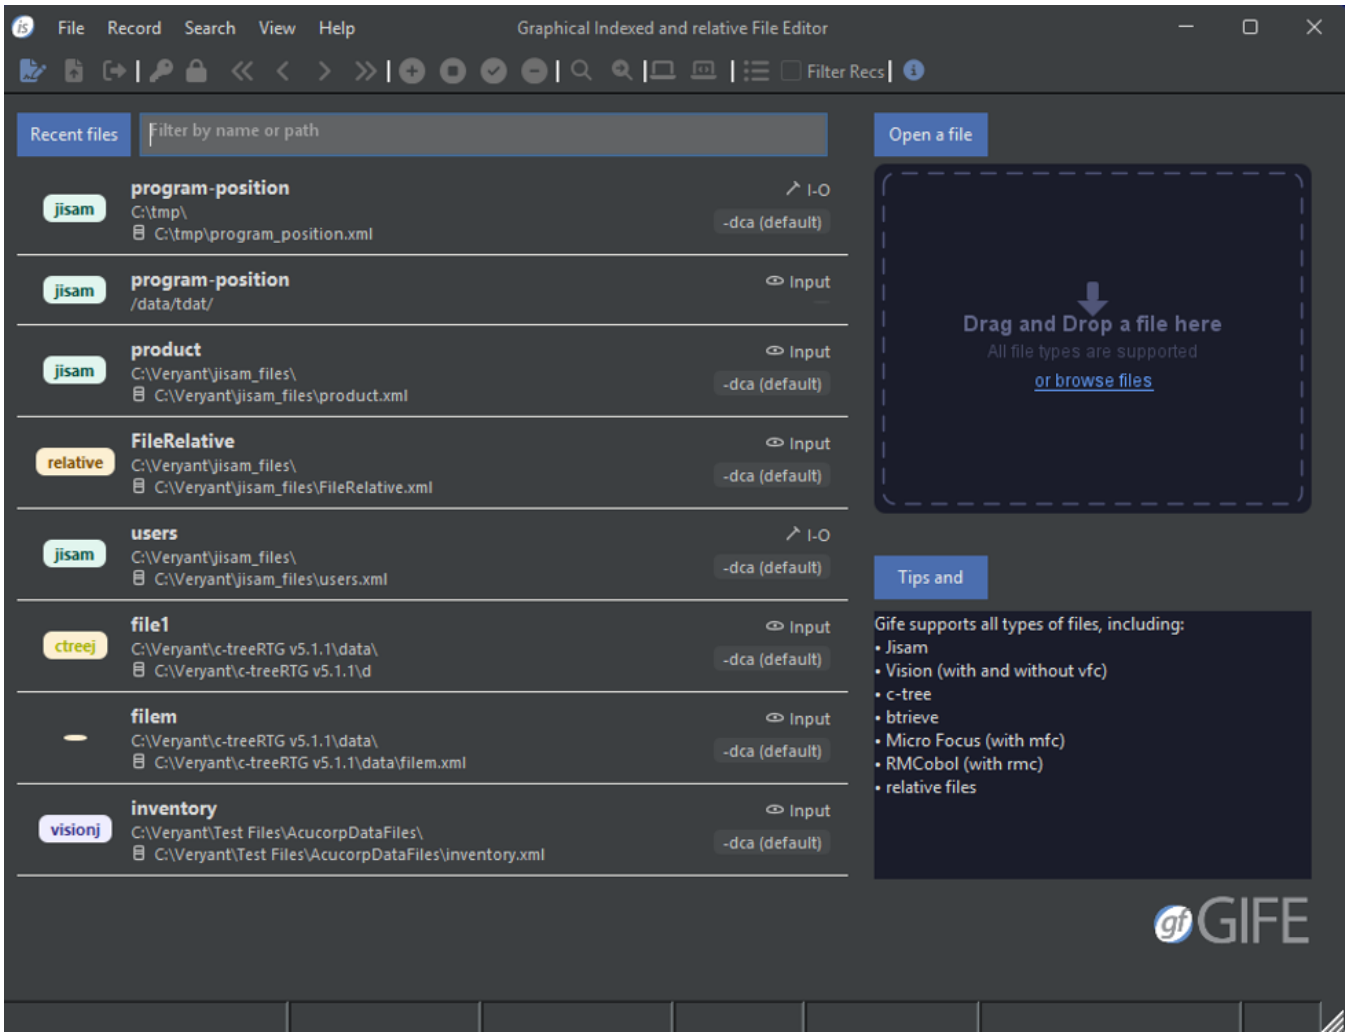

Gife

Gife can be started in either of the following ways:

1. Run the gife wrapper located in $ISCOBOL/bin.
2. Start it using the runtime's -utility option.

To run Gife in dark mode, start it using the second method and add the --flatlaf FlatDarkLaf option:

```
iscrun --flatlaf FlatDarkLaf -utility GIFE
```
