## Does SET ADDRESS OF X TO Y work?

$\Omega_{11}$	acti	on:
Vu	CSU	uii.

I have some code that uses M\$ALLOC and then assigns the address of an array (in the linkage area) to the space just allocated. Code fragment below. There is a note in the migration section that "SET X TO ADDRESS OF Y" requires compiling with the -cp option to enable full POINTER support. But I am using only "SET ADDRESS OF X TO Y" and am not calling C functions.

000419 CALL "M\$ALLOC" USING IMG-ROW-SIZE,000420 IMG-ROW-PTR,000421 SET ADDRESS OF IMG-ROW TO IMG-ROW-PTR,

Where IMG-ROW is an array in the linkage section.

## Answer:

The answer is yes. SET ADDRESS OF X TO Y is supported. Use the -ca compiler option.

Note: If you plan to exchange pointers with C functions then enable full POINTER support by compiling with the -cp option.

If you are using a USAGE POINTER item internally, within COBOL (i.e. not to pass to C functions), SET X TO HANDLE OF Y works as desired and gives the same behavior as SET X TO ADDRESS OF Y in ACUCOBOL.

In addition, "SET ADDRESS OF X TO Y" works as expected.

Because of Java constraints, with is COBOL, M\$ALLOC returns a handle, not an actual memory address. When you set the address of a linkage item to the handle value, the program behaves as desired because internally Java uses handles to identify objects, not pointers.

If you compile with -ca, then the program you described will compile and run as it did with ACUCOBOL. If you don't compile with -ca then you simply need to change USAGE POINTER to USAGE HANDLE wherever it occurs in the data division.

Here is an example program:

id division. program-id. malloctest. data division. working-st orage section. 77 img-row-ws pic x(50). 77 img-row-ptr usage handle.

```
linkage section. 01 img-row. 03 filler pic x occurs 50. procedure d
ivision. main-logic. set address of img-row to address of img-row-ws.
  move "Message 1" to img-row. display img-row. move "Message 2" to img-
     display img-row-ws.
                                move "Message 3" to img-row-ws.
                                                                   display i
mg-row.
           move "Message 5" to img-row-ws.
                                             CALL "M$ALLOC" USING length of im
               IMG-ROW-PTR,
                                SET ADDRESS OF IMG-ROW TO IMG-ROW-PTR,
g-row,
ve "Message 4" to img-row. display img-row. display img-row-ws.
                                                                        mo
ve "Message 6" to img-row-ws. move "Error" to img-row.
                                                           display img-row-
ws.
```

The output of program is:

Message 1

Message 2

Message 3

Message 4

Message 5

Message 6
