## How does is COBOL limit the size of database query working set for the START statement?

Question:
With ACUCOBOL-GT my program used the A4GL_WHERE_CONSTRAINT external variable in order to add further constraints to the SQL SELECT statement generated for the COBOL START statement.  For example,
Move "ftest_key > 3 and ftest_key < 6" to A4GL_WHERE_CONSTRAINT. Inspect A4GL_WHERE_CONSTRAINT replacing trailing spaces by low-values. START FTEST-FILE KEY NOT LESS FTEST-KEY.
How can I accomplish the same thing in isCOBOL?
Answer:
You can set the external variable EDBI-WHERE-CONSTRAINT, that works the same way as A4GL-WHERE-CONSTRAINT.
