Do I need to worry about the compile warning "Note: MYPROG.java uses unchecked or unsafe operations?"

In isCOBOL you may get a Java note saying something similar to
"... uses unchecked or unsafe operations."
This warning is displayed when you execute code which the Java compiler considers to be lacking in error-checking, or potentially unsafe in some way.
This is just a warning though, and won't stop your code from compiling and running.

You can recompile the source code with -jo="-Xlint:unchecked" option to see a more specific message. For instance:

```
   java com.iscobol.compiler.Pcc -jo="-Xlint:unchecked" *.cbl   I --> IsControlSet.cbl
  Compiling result   Informational(s) - 0   Warning(s) - 0   Error(s) - 0   Severe erro
r(s) - 0   II--> ISCONTROLSET.java   ISCONTROLSET.java:2852: warning: [unchecked] unche
cked call to addElement(E)as a member of the raw type java.util.Vector       VECT.addEl
ement("Year 2001");
```

Though this note will not affect your application run, the code causing the error could have been remoted in a newer version of isCOBOL, as we continually strive to improve our product.
Therefore, you have two options. You can:

1. Ignore this warning.
2. Upgrade to a newer isCOBOL version, and report the error to support if it still occurs.
