

# How can I tell what changes were made in the isCOBOL latest update?

Author: Veryant Support

Saved From: <http://support.veryant.com/support/phpkb/question.php?ID=117>

Each installation setup includes a README. This README file lists all the new features in that release. There is also a file named CHANGELOG.txt that lists all changes in the release, in order of build and ID number.

For instance, if you update from version 2023R1 build 1090.6 to 1090.7, the CHANGELOG lists these changes:

```
### Build 1090.7 (09 Mar 2023)
  = [ID #29684] C$KEYMAP and C$ENVMAP routines are now more relaxed on
parameters check
  = [ID #29677] fixed a wrong stream generated by JSONStream class with nested
dynamic occurs
  = [ID #29661] fixed an issue on puttons with bitmap-scale set and
bitmap-width not set
  + [ID #29650] JDBC driver version is now traced in the log
  + [ID #29649] new compiler option -ccmf to have MF compatibility in numeric
literals passed in CALL statement
  = [ID #29625] fixed a wrong arg-type returned by C$CARG and C$DARG routines
in a particular case
  = [ID #29489] fixed an issue on C$OPENSABVEBOX under WebClient with Cluster
environment
```

You can install each release over the last one. There's more information about that in [KB #330](#)
