How can I get the system-information data from the client computer?

The best way to achieve this is to CALL CLIENT the C$SYSINFO library routine.
 It returns information about the current operating system.
 In general this library routine produces the same result as the ACCEPT SYSTEM-INFORMATION FROM SYSTEM-INFO statement.
 However, on Thin Client environment, the ACCEPT approach would bring the system-information data from the server only, while the CALL CLIENT "C$SYSINFO" would bring the specific client information instead.
