The most reliable way to retrieve this kind of info is by calling Windows functions.

The API function GetUserName does the trick.

Please give the following code a try:

```
program-id. prg.
  working-storage section.
  77  userName pic x(32).
  77  len      pic 99 value 32.

  procedure division.
  main.
    call client "C$SETENV" using "dll_convention", "1".
    call client "GetUserNameA" using by reference userName
                                   by reference len
      on exception
        call client "ADVAPI32.dll"
        call client "GetUserNameA" using by reference userName
                                   by reference len
    end-call.
  display userName.
  goback.
```
