

Are there some samples to see how to work with JavaBeans?

Yes, there are several examples in the `%ISCOBOL%/sample` directory.

There is a sample for a 3-D pie chart in `issamples/SAMPLES`.

You can see this same chart in `iscontrolset/ISCONTROLSET` with options to view the data in a bar and line chart as well.

There are more samples of JavaBeans in the `is-java/javabeans` folder.

These include an `html-editor`, `jcalendar`, `jprogress`, and an `rtf-editor`.

JavaBeans are external components that can be used by isCOBOL as standard controls.

They can be defined in the screen section and used by the `DISPLAY`, `MODIFY` and `INQUIRE` statements.

They also raise events that should be handled in the event procedure.

More information about JavaBeans is in the isCOBOL documentation's User Interface Reference, under Controls Reference-> `JAVA_BEAN`
